

DayFrame Month Planner Design Specification v1.0

DayFrame Month Planner Design Specification v1.0

1. Purpose

The Month Planner is the primary interaction surface of DayFrame. It is a decision-support interface built around the user's finite time. Every visual element, interaction, and recommendation exists to help the user intentionally invest that time in accordance with their commitments, goals, and priorities.

Primary Responsibilities:

- Orient the user within time.
- Display commitments and goal allocations.
- Communicate remaining capacity.
- Surface scheduling friction.
- Provide access to the Daily Workspace.
- Minimize navigation overhead.

Primary Questions:

1. Where am I?
2. What must happen?
3. What should I work on?
4. How healthy is today?
5. What should I do next?

Design Rationale:

Traditional calendars answer 'What events exist?'

DayFrame answers 'How should I intentionally invest my time today?'

2. User Experience Goals

The Month Planner shall be calm, fast, predictable, trustworthy, and respectful of the user's attention.

User Mental Model:

Select a Day → Understand the Day → Act on the Day → Return to Living.

Navigation Philosophy:

Navigation exposes experiences (Planner, Daily Workspace, Summary) rather than implementation objects.

Cognitive Load Principles:

- Recognition over recall
- Progressive disclosure
- Immediate feedback
- Consistency
- Minimal friction

Emotional Goals:

Users should feel oriented, in control, confident, focused, and encouraged.
